Advisory Action

- 1. The proposed amendment will not be entered because they raise the issue of new matter, and new issues that would require further consideration and search for the reasons set forth below.
- 2. The amendment does not comply with the requirements of 37 CFR 1.121(c) because the withdrawn claims must include the text next to the status.
- 3. The proposed amendment of claim 1 now recites a Markush group of an alignment layer comprised of a mono- or multi-layer of liquid crystal material, or a combined alignment layer comprised of at least one azosilane or of a polymeric material selected from the group consisting of polyester, polypeptide, polyacrylamide, polyvinylalcohol, polyacrylate, polymethacrylate, polyurea and polyamide. The scope of the claim has changed. In the previously presented claim, there was a clear recitation of "a mono or multilayer of liquid crystal material on said at least one alignment layer". The specification states that the invention has two embodiments, one being an alignment layer with a mono or multilayer of liquid crystal material on the alignment layer, the other being a combined alignment layer (Page 8, 2nd paragraph, substitute specification filed 01/18/01). There does not appear to be a recitation of a mono- or multilayer of liquid crystal as an alignment layer in the specification, thus raising the issue of new matter.
- 4. The combined alignment layer is not well defined in the specification. The recitation of "The combined alignment layer that can be used instead of the *separated* alignment layer and liquid crystal layer" (Page 7, 4th paragraph, substitute specification filed 01/18/01) implies that the combined alignment layer is some combination of the alignment layer and the liquid crystal layer with no clear demarcation between the alignment layer and the liquid crystal layer, which

Application/Control Number: 09/744,113

Art Unit: 1772

means that there is liquid crystal in the combined alignment layer, at the very least, if not some form of layered structure involved. There are prior art hybrid alignment layers which have liquid crystal moieties covalently attached to non-liquid crystal polymeric alignment material.

5. Applicant argues that Georger, either alone or in combination, fails to teach neurite outgrowth. Applicant is respectfully apprised that Georger does indeed specifically teach neurite outgrowth ('628, column 5, lines 15-20).

Furthermore, Applicant is respectfully reminded that a recitation of the intended use of the claimed invention must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claim. In a claim drawn to a process of making, the intended use must result in a manipulative difference as compared to the prior art. See *In re Casey*, 152 USPQ 235 (CCPA 1967) and *In re Otto*, 136 USPQ 458, 459 (CCPA 1963).

- 6. Applicant argues that Georger does not disclose or suggest liquid crystalline material as a separate layer or in a combined layer. Applicant is respectfully apprised that liquid crystal is indeed taught as a transducer on which a single (neuron) cell is located ('628, column 10, lines 40-65).
- 7. Applicant argues that Kawata fails to teach the orienting neurite outgrowth, or the instantly claimed substrate structure, and that there is no motivation to combine the teachings of Kawata with that of Georger.

Applicant is respectfully reminded that Kawata teaches that the alignment defect for an alignment layer formed with the azobenzene chromophore is lower than one formed without

Application/Control Number: 09/744,113

Art Unit: 1772

('113, column 17, lines 1-50). Both Kawata and Georger are directed to a film for alignment on a substrate, and are thus analogous art. Therefore it would have been obvious to one of ordinary skill in the art to have used the azobenzene sidechain liquid crystalline polyester taught by Kawata as the alignment surface with microtrenches in the invention of Georger in order to obtain a substrate structure for neurite outgrowth with higher alignment precision due to lower alignment defect.

8. Applicant argues that Grainger only mentions antibodies that are attached to the polymeric article and can thus be used in analytical techniques, such as immunoassays, which is not cell growth.

Applicant is respectfully apprised that Grainger does teach that the polymer is bound across the surface of a substrate in a predetermined alignment (pattern) as points of attachment for cell growth ('549, column 15, lines 10-20) thus acting as an alignment layer on the substrate for cell growth.

9. Applicant argues that neurite outgrowth is different from cell growth in that neurite outgrowth is the formation and extension of a neuron by way of neurites, the term neurite relating to the combination of axon and dendrites.

Applicant is respectfully apprised that the primary reference Georger does teach neurite outgrowth as discussed above. Grainger is the secondary reference which teaches that the polymer is bound across the surface of a substrate in a predetermined alignment (pattern) as points of attachment for cell growth ('549, column 15, lines 10-20), thus acting as an alignment layer on the substrate for cell growth. The conditions for cell growth are necessary for neurite

outgrowth. Hence there is motivation to combine and expectation of success present in the prior art.

Any inquiry concerning this communication should be directed to Sow-Fun Hon whose telephone number is (571)272-1492. The examiner can normally be reached Monday to Friday from 9:00 AM to 5:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Harold Pyon, can be reached at (571)272-1498. The fax phone number for the organization where this application or proceeding is assigned is (703)872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
